Overview

Full-stack engineer with 15+ years building products from zero — most recently as the first engineer at an AI debugging startup, previously as a founding engineer at Everlane. Specialize in shipping new product surfaces end-to-end: agentic AI systems, observability infrastructure, e-commerce platforms, and the UI design on top.

Skills

Languages: TypeScript, JavaScript, Ruby, SQL, Swift

Frameworks: React, Next.js, React Native, UIKit, SwiftUI, Node, Ruby on Rails, AI SDK, GraphQL

AI/Infra: OpenTelemetry, ClickHouse, Chroma, Braintrust, multi-agent systems, LLM evals

Data: Postgres, MongoDB, MySQL, Redis

Other: AWS, Figma, Adobe Suite, Git, SEO

Experience

Foam.ai | March 2025 - March 2026

First engineering hire at an AI startup that automatically debugs production software — investigating errors, identifying root causes, and proposing fixes. Built and shipped the product to customers and design partners including Braintrust, Perplexity, Together AI, and GPTZero.

Founding Engineer | Full Stack

- **Architected the observability stack from zero**
 - Built an end-to-end telemetry pipeline on OpenTelemetry + ClickHouse, capturing traces, logs, and metrics from browser to backend.

- Ingested frontend source maps to surface production stack traces with original source context.
- Shipped the web client, API, and backend services across TypeScript, Node, Next.js, Postgres, and MongoDB.
- **Built the LLM-powered root-cause investigation system**
 - Designed a hierarchical multi-agent architecture: an orchestrator triaged exceptions to specialized research, coding, and testing sub-agents, with LLM-as-judge selecting candidate root causes.
 - Achieved 86% root-cause accuracy on internal benchmarks, vs 41% for off-the-shelf coding agents.
 - Matched new exceptions against historical root causes via per-customer Chroma vector stores, short-circuiting redundant investigation.
 - Integrated customer repos, git history, and language servers (via OpenCode) into the agent toolchain for source-aware reasoning.
 - Scoped each agent with bespoke tools (web search, ClickHouse SQL, shell, git); instrumented the pipeline with Braintrust for eval-driven regression.
- Designed and built the full UI, from marketing site to in-product observability tooling.
- Hired seven engineers as the technical bar-raiser across the interview loop.

Everlane | July 2013 - April 2024

I served as one of the founding three engineers, building the e-commerce platform from the ground up with a small team of three engineers and one designer. Transformed a brand vision into a successful, multi-hundred-million-dollar business.

Senior Engineering Lead

- Grew the engineering, product, and design team to 30 people.
- Led an increase of organic and paid search traffic by 15%.
- Boosted add-to-cart rate from 8% to 11% through enhancements to site and in-page navigation.

Senior Product Engineer | Full Stack

- **Built and scaled the custom commerce platform**
 - Built Everlane's e-commerce platform from scratch on Ruby on Rails, before Shopify was trusted architecture for brands at scale.
 - Evolved the platform into a Rails API serving tens of thousands of daily visits, with a custom checkout flow processing \$300k–\$400k in daily purchases.

- Owned supply-chain logistics, inventory management, and in-house web analytics as native services on the same platform.
- **Increased customer trust and conversion**
 - Proposed and led the implementation of quick add-to-cart, a model selector to view styles on a diverse set of size-inclusive models, and various forms of in-site navigation such as recommended products.
 - Integrated with payment processors in checkout such as Braintree, ApplePay, Stripe, Afterpay, and ShopPay; leading to increases in conversion by as much as 30%.
 - Built a customized Point of Sale app for all Everlane brick-and-mortar stores using Swift and React Native.
- **Empowered brand and marketing teams to self-serve**
 - Identified, championed, and implemented the prototype for the headless CMS solution Builder.io — a buy-vs-build decision after in-house tooling became too inefficient and resource-intensive.
 - Led the integration of a robust Digital Asset Management (DAM) system, streamlining the workflow from raw photo assets to customer-facing imagery — 40% reduction in redundancies, 32% decrease in page load time, and 4% increase in sales from smaller asset sizes.
 - Increased the SEO indexable page footprint by 400% by creating SEO and user friendly URLs for filtered product listing and search pages.

CBS | December 2011 - July 2013

Software Engineer | Full Stack

- Built the first mobile sites for CNET and CBS News as an early adopter of Node.js — among the first single-page applications deployed at scale, working alongside the Mootools team at CBS.

Education

Art Institute of California, San Diego
Bachelor of Science | Computer Science

California State University, Fullerton
Associate of Arts | Music Theory and Composition
